Approvals				

* Flamerod cannot be selected if gas is rotated 90° clockwise from air inlet.

¹ Maximum inputs for packaged blower versions are given for the standard combustion air blower without an inlet air filter.

² Blower motor service factors greater than 1.0 may be required when firing into negative chamber pressure applications. For specific application questions, contact Eclipse.

³ For proper performance, this pressure must be kept constant across the burner operating range.

⁴ All weights are approximate.

⁵ See Design Guide 115 for more information about typical fuel composition and properties.

- All inputs based upon gross calorific values and standard conditions: 1 atmosphere, 70°F (21°C).
- Blower motor service factors greater than 1.0 may be required when firing into negative chamber pressure applications. For specific application questions, contact Eclipse.
- Eclipse reserves the right to change the construction and/or configuration of our products at any time without being obliged to adjust earlier supplies accordingly.
- All information is based on laboratory testing. Different chamber conditions will affect the data.

Straight Combustor Specifications

NO_x Emission (On ratio)

NO_x emission data is given for:

- Ambient combustion air ~70°F (21°C)
- Minimal process air velocity
- ppm volume dry at 3% O₂
- Neutral chamber pressure

Emissions from the burner are influenced by:

- Chamber conditions
- Fuel type
- Firing rate
- Ratio regulator adjustment
- Combustion air temperature

CO emission is largely influenced by chamber conditions. Contact your local Eclipse representative for an estimate of CO emission on your application.

Fuel Orifice Δp vs. Input (Δp Measured Between Taps B and D)

Even though the blower motor is on the "left" side of the inverted units, it is still a "right hand" motor in relationship to the blower assembly.
