

June 2013

Description

The TFZ Programmable FOUNDATION Fieldbus Temperature Transmitter saves wire and installation costs by allowing up to 32 field devices to be networked onto one, low cost FOUNDATION fieldbus H1 segment.

The loop-powered (2-wire) TFZ offers dozens of input and operation choices. It sets up from the control room over segment wiring using a standard FOUNDATION fieldbus configuration tool to handle 14 RTD types, 9 thermocouple types, as well as direct millivolt and resistance/potentiometer inputs. It converts the input to a FOUNDATION fieldbus H1, two-way digital communication protocol ready for interface with an AMS, DCS or PLC.

Easy-to-Order Temperature Assemblies

One simple model number is all it takes to order our complete temperature assemblies. They include your choice of general location or hazardous area connection head, RTD or T/C sensors, thermowell and process connection.

Available in a variety of mounting styles, the TFZ installs on a pipe or surface in the field, or on a DIN-rail and relay track in a multi-unit enclosure or cabinet.

Features

- **Industry-standard FOUNDATION fieldbus communication.** Featuring a bus connection in accordance with IEC 61158-2 and EN 50170, part 4, the TFZ can be installed in the same segment with all standard FOUNDATION fieldbus devices.
- **Exceptional measurement accuracy.** 20-bit input resolution delivers precise, industry-leading measurements.
- **Easy-to-read, customizable local display.** The large display features alphanumeric characters that can be read easily in the field. It can be customized to display the process variable or the output in user-selectable engineering units.
- **Delivers valuable diagnostic information.** Standard FOUNDATION fieldbus diagnostics provide indication of unwanted process and transmitter conditions.
- **Remote configuration and diagnostics.** The ideal universal plant standard, the TFZ offers versatile input and operation choices, and still can be configured and troubleshooted quickly over the segment, from the control room.
- **Long-term stability.** Provides up to 5 years between scheduled calibrations.
- **Advanced RFI/EMI protection and ambient temperature compensation.** Guard against environmental factors that can quickly degrade measurement accuracy.

TFZ

Programmable FOUNDATION Fieldbus™ Temperature Transmitter

Multidrop Networks Save Wiring Costs

The TFZ is an H1 Basic Device that conforms to the H1 Standard (IEC61158-2, 31.25 kbits/s) and is implemented as a Group 3 (network configurable), Class 31* device.

Acting as a Slave device within a FOUNDATION fieldbus H1 network, up to 32 TFZ transmitters connect in a fieldbus (Figure 2) segment. This means you can save time and money by using a single twisted pair, instead of individual loops, to transmit information from multiple devices.

Function Blocks

Resource Function Block (RB)—Contains diagnostic information, hardware and electronics information (memory, manufacturer identification, device type, software tag) and display configuration parameters.

Temperature Transducer Block (TB)—Contains temperature measurement data, including sensor and terminal temperature. It also includes information about the sensor type, engineering units, linearization, re-ranging, damping, temperature compensation and diagnostics.

Analog Input Block (AI)—Processes measurements from a sensor and makes them available to other function blocks. The output value from the AI block is displayed in engineering units and contains a status indicating the quality of the measurement.

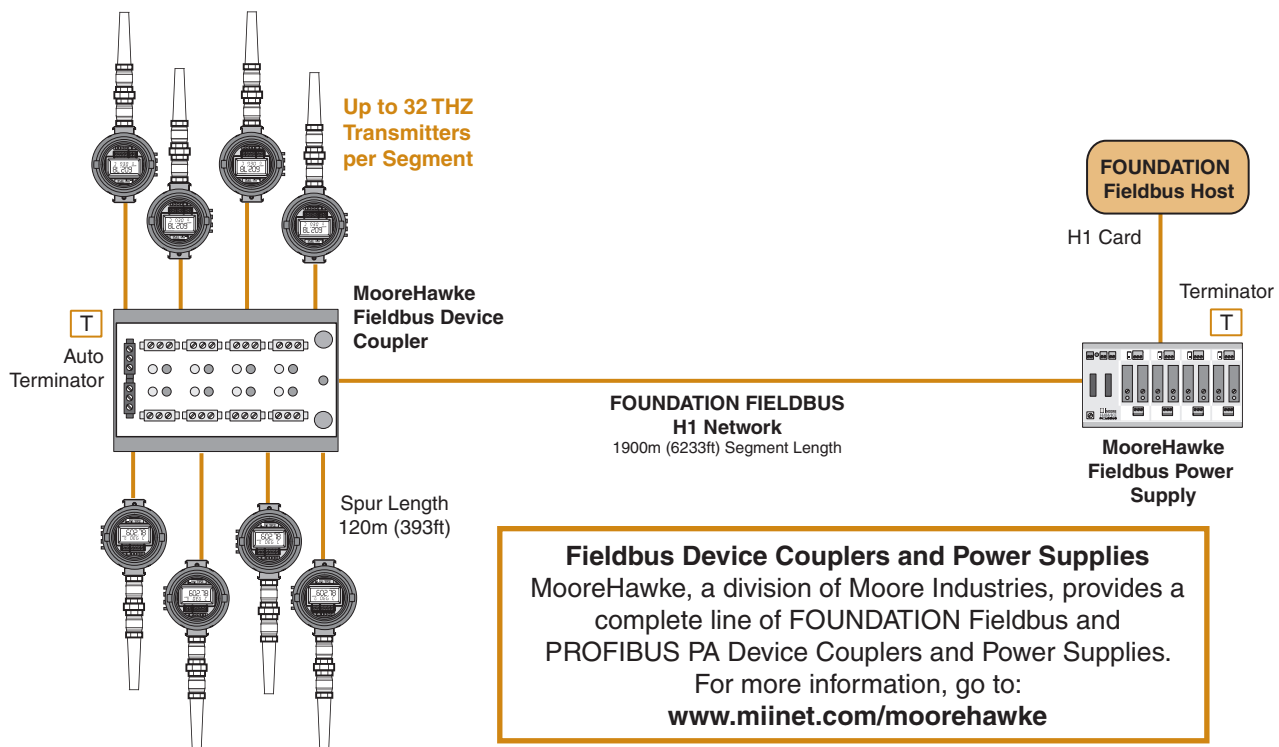

Sets Up from a Hand-Held, DCS or Asset Management System (AMS)

Using its Function Blocks, the TFZ can be remotely programmed in minutes, or interrogated at any time, over the segment using a standard FOUNDATION fieldbus configuration tool. Examples of programmable parameters include:

- **Identification Information**—Product designation/part number, tag, descriptor, installation date, slave address and FOUNDATION fieldbus identification number.
- **Input/Output and Ranges**—Sensor type, span and zero values, lower/upper output ranges and alarm output status.

* Class 31 indicates that the device might publish and/or subscribe data and/or is a client.

Figure 2. The TFZ transmitter's data and configuration can be viewed, tested and changed from the control room using a HART hand-held configurator, DCS or AMS equipped with a standard FOUNDATION fieldbus configuration tool.

- **Set Damping Time**—Eliminate imprecise readings caused by noise and other insignificant process fluctuations by setting a damping time between 1-30 seconds.
- **View Real-Time Process Values**—View the existing process value (in the appropriate engineering unit), and lower and upper range values as a percentage of output span.

Non-Volatile Memory

If power to the transmitter is lost, the unit resumes normal operation with the parameters you've configured upon reapplication of power.

Total Sensor Diagnostics

TFZ transmitters perform continuous sensor diagnostics. This patented Moore Industries feature can save you from costly lost production time and hours of troubleshooting. If the sensor breaks or otherwise stops sending a signal during operation, the transmitter instantly displays the type and location of the error on its display.

Precise Linearization and RJC

The TFZ uses an advanced linearization method to minimize conformance error. Its Reference (Cold) Junction Compensation techniques produce stable readings even in fluctuating ambient temperature conditions. For non-linear inputs, create custom linearization curves using the fieldbus configuration tool.

Figure 3. The TFZ can be set to measure the segment most critical to the process.

Trims to Respond to Specific Sensor Curve Segments

Most transmitters zero and span values can be calibrated to measure a specific range within a sensor's overall curve capability. However, for even greater measurement accuracy, our transmitter's trim capabilities go much further.

The TFZ can be trimmed with two data points within the selected zero and span measurement range. This advantage allows a complete process range to be monitored, while placing measurement emphasis on a specific segment of the range most critical to the process.

In Figure 3, the actual sensor curve is used in place of the ideal RTD curve between 20°C and 27°C. This provides incredible precision over a limited portion of the span, while measuring the remainder of the span with the TFZ's usual outstanding accuracy.

Specifications

<p>Performance Input Accuracy: Refer to Table 4 Overall Accuracy: The overall accuracy of the unit is the input accuracy. It includes the combined effects of linearity, hysteresis, repeatability and adjustment resolution. It does not include ambient temperature effect. For T/C input, add the RJC error. Reference Junction Compensation: ±0.45°C (±0.81°F) Stability: Refer to Table 1 Isolation: 500Vrms between input, output and case continuous, and will withstand a 500Vac dielectric strength test for one minute (with no breakdown) Step Response Time: 500msec, maximum, 256msec typical from the time an input is applied until the time the corresponding floating point processed variable is available to be read by other FOUNDATION Fieldbus devices Over-voltage Protection: Input, ±5Vdc peak, maximum Digital Input Filter: 50/60Hz (user-selectable)</p>	<p>Performance (Continued) Power Supply Requirement: 9-32Vdc, 10.5mA typical 12.07mA maximum under normal operation; 18mA maximum under fault conditions Supply Range: 9-32V, Foundation Fieldbus Approved Load Effect: N/A T/C Input Impedance: 40Mohms, nominal Excitation Current: RTD and Ohms, 250 microamps, ±10% RTD Lead Wire Resistance Maximum: RTD resistance + 2X lead wire resistance <4000 ohms; Recommended lead wire resistance for three wire connections: <35 ohms/wire; 10 ohm copper sensor <5 ohms Sensor Lead Resistance Effect: 1.0 ohm in reading/ohm of lead resistance for 2-wire sensors; 1.0 ohm in reading/ohm of lead of unbalanced resistance for 3-wire sensors; no effect on 4-wire sensors Resolution: Input, 20-bit</p> <p>Display Type: Top Row, 10mm (0.4 in) high black digits on a reflective background; Bottom Row, 6mm (0.225 in) high digits on a reflective background;</p>	<p>Display (Continued) Two-digit FOUNDATION Fieldbus address indicator Format: Two rows of five alphanumeric characters Decimal Points: Automatically adjusted decimal point with a user selectable maximum up to four places Range: -99999 to 99999 Minimum Display Span: 1.00</p> <p>Ambient Temperature Operating and Storage Range: -40°C to +85°C (-40°F to +185°F) Relative Humidity: 0-95%, non-condensing Ambient Temperature Effect: Refer to Table 2 Effect on Reference Junction Compensation: ±0.005°C of input span/°C change of ambient temperature RFI/EMI Immunity: 20V/m@80-1000MHz, 1kHz AM when tested according to IEC 1000-4-3-1995 with 0.5% of span or less Startup Time: Performance falls within specification 8 seconds after power is applied Noise Rejection: Common mode, 100dB@50/60Hz; Normal Mode: Refer to Table 3</p> <p>Weight 210g (7.4 oz)</p>
